

Work that comes back every week shouldn't need a human.

Chasing quotes, transferring documents, maintaining product data, typing numbers from one system into another: those aren't IT projects, they are automations. Much of it doesn't need AI at all, it needs a clean connection between systems that don't talk to each other today. AI joins in where messy input has to become structure. I don't sell anything I don't run myself.

Connecting systems

ERP, shop, accounting, email: data flows automatically instead of via copy and paste. Built with n8n, running on your infrastructure or hosted in the EU.

Quotes & follow-up

Quote goes out, the reminder runs by itself. No quote is left unanswered because daily business got in the way.

Documents & invoices

Invoices and delivery notes go from the inbox straight into accounting. The AI reads the contents, you only review.

Product data

Supplier lists into the shop without Excel afternoons. Prices, stock and copy update themselves.

Call

€0

Free, 30 minutes, no strings attached. You describe the daily routine, I tell you honestly whether automation pays off.

AI Fitness Check

€890

Half a day on site or remote plus a written assessment. Credited in full against a sprint booked within 30 days.

Build Sprint

€4,900

Two weeks, fixed price. At the end, exactly one automation runs in your production environment.

Operations

monthly

Monitoring, adjustment and expansion of the running automations.

You pay when it runs.

The Build Sprint is invoiced after go-live: the automation runs in your business the way the AI Fitness Check report describes it. If it doesn't run, there is no invoice.

Condition: the scope comes from the AI Fitness Check, and access plus a point of contact are available from the start of the sprint.
